

# Welcome to Chromium OS for Raspberry Pi 2 & 3

## Welcome!

Thank you for downloading and installing the latest release of Chromium OS for the Raspberry Pi 2 & 3. We hope you enjoy using this as much as we've enjoyed porting it across. This sheet provides some useful information to get you started quickly.

Thanks again from the Chromium OS for Single Board Computers development team.

## Recommended Setup

Disable extensions; they slow down the browser and use precious memory.

Create a new gmail account, this will have less baggage to sync across to the Raspberry Pi's limited storage.

Be patient, the SD card isn't as fast as an SSD, its 10x slower.

## Keyboard Shortcuts

**CTRL + ALT + /** Show all keyboard shortcuts

**Windows key** Open the Search menu

**CTRL + N** Open a new window

**Windows key + ESC** Open the Task Manager

**F9 & F10** Volume down and up

**F8** Mute volume

**F5** All open windows

**F4** Full screen

## Enjoy

Remember, raspberry pi 2 only has 1Gb ram and chromium uses most of that (Chromebooks have at least 2Gb minimum), so its best to have only a few tabs open at once.
